NUCLEAR ENGINEERING & RADIOLOGICAL SCIENCES
UNIVERSITY OF MICHIGAN

Lecture 25

HPC + Jupyter Notebooks + Workflows

Prof. Brendan Kochunas
12/4/2019

NERS 590-004

Outline

- Introduction to Jupyter Notebooks
- Running Jupyter on Great Lakes
- Tips & Tricks in Jupyter
- Hands on Demos

Today's Learning Objectives

- Know how to run a jupyter notebook on Great Lakes
- Know how to get other code into Jupyter
- Know how to interact with Great Lakes from inside Jupyter

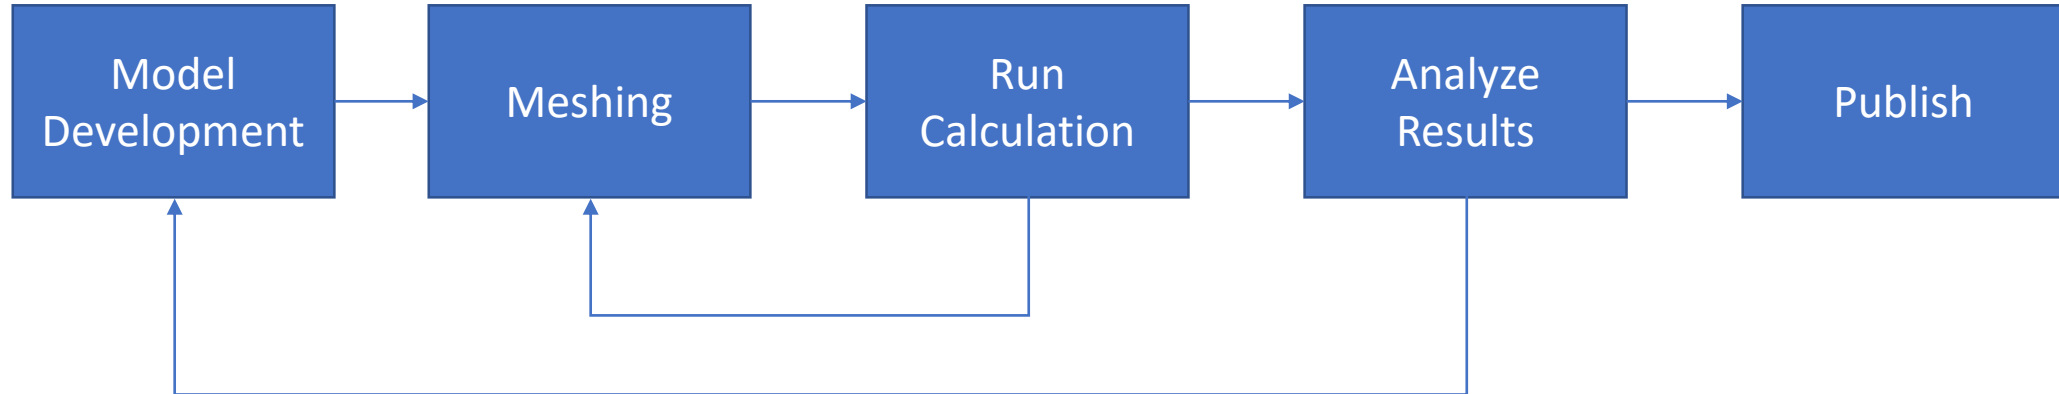

Why should I care about Jupyter Notebooks and HPC?

- As we've learned throughout the semester HPC is challenging to use
 - This is somewhat inherent in the design
- But—does it have to be difficult?
- Other languages (e.g. Python or MATLAB) are much better for *productivity*
- From Lecture 2
 - ***“Simulation in the climate community is dominated by the nexus of the Fortran/C/C++ languages and the OpenMP/OpenACC programming models. While both Fortran and C/C++ are interoperable on almost all computing platforms available today, there is a strong desire for other productivity oriented scripting languages in a distributed environment (e.g., Python/pyMPI), as well as the desire to move away from the flat MPI model, which may be functional on the next generation of systems but will lose a factor of 10 to 50 times on GPU-accelerated systems.”***

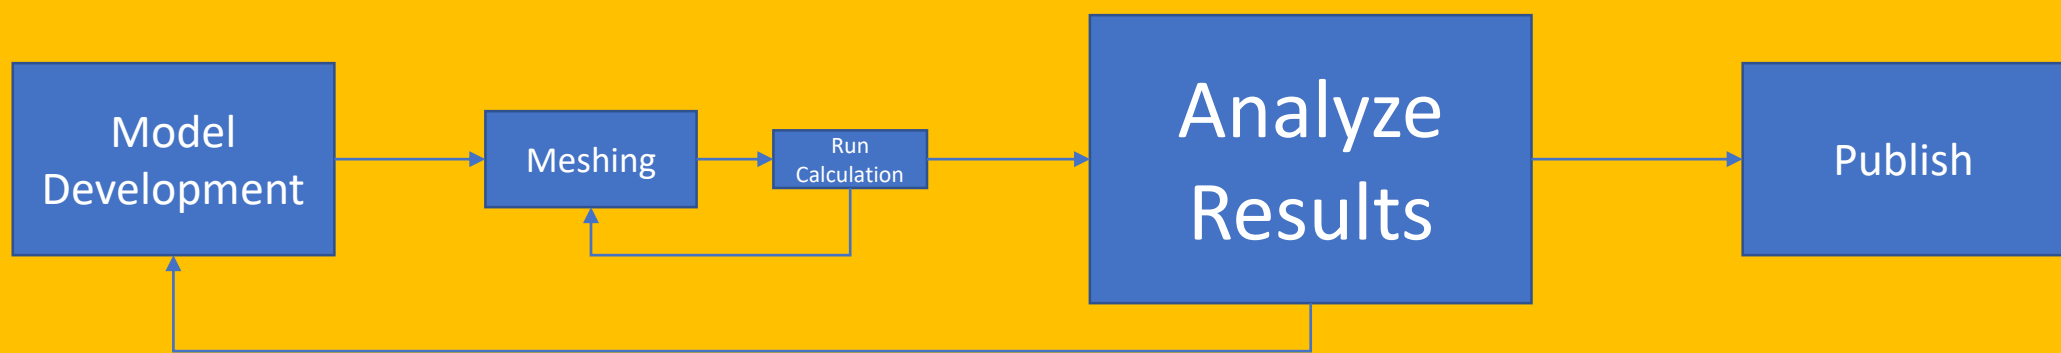

Typical Modeling and Analysis Workflows

What is the distribution of effort for these tasks?

Typical Modeling and Analysis Workflows

Notebooks can be used to integrate and automate these workflows.

Jupyter Notebooks

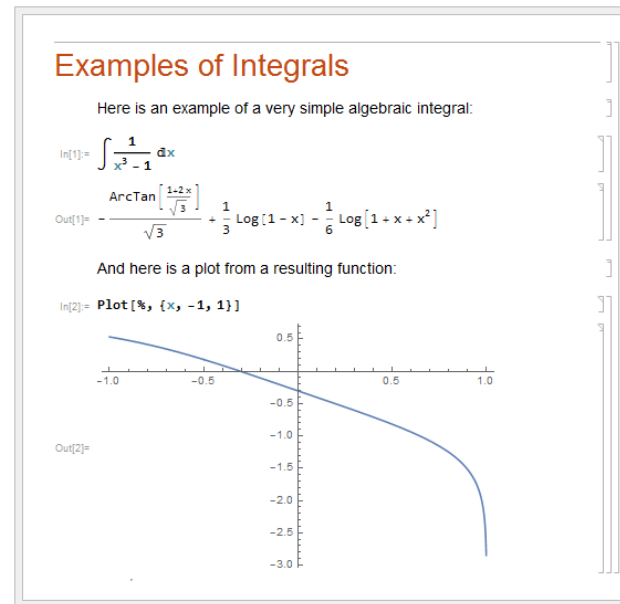

Background

- Jupyter – **JULia**, **PYThon**, and **R**
 - Open Source and developed by Project Jupyter—a nonprofit
- Grew out of the IPython (Interactive Python)
 - Evolved and replaced the IPython notebook
- IPython was designed to utilize parallel computing
 - e.g. task and data parallelism, SIMD, and MIMD
- Key concept is the Notebook Interface

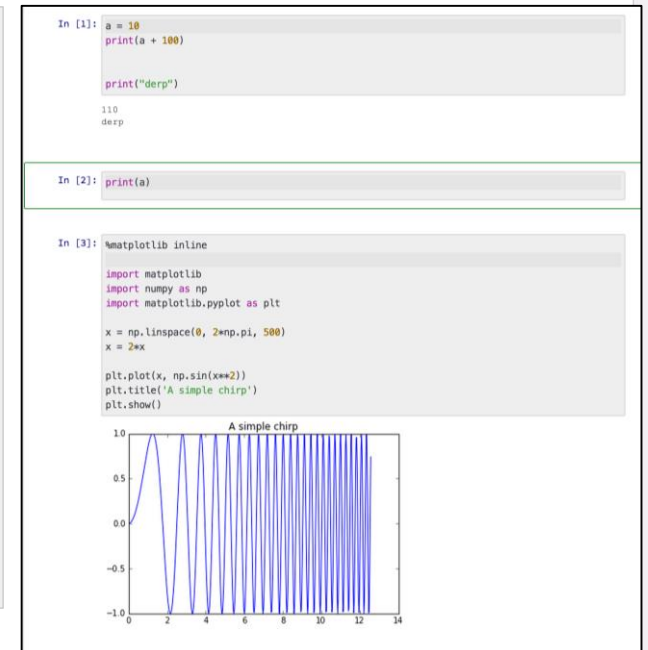

Concept of a notebook

- Notebook is composed of cells
- Cells can be of different types
 - Functional/Evaluatable
 - Text or Documentation (with nice formatting)
- Can be exported to other formats
 - HTML, PDF, etc.
- Not a new concept
 - Existed in Mathematica long before Python
- Excellent for expositions that involve computations

Mathematica

Jupyter Notebook

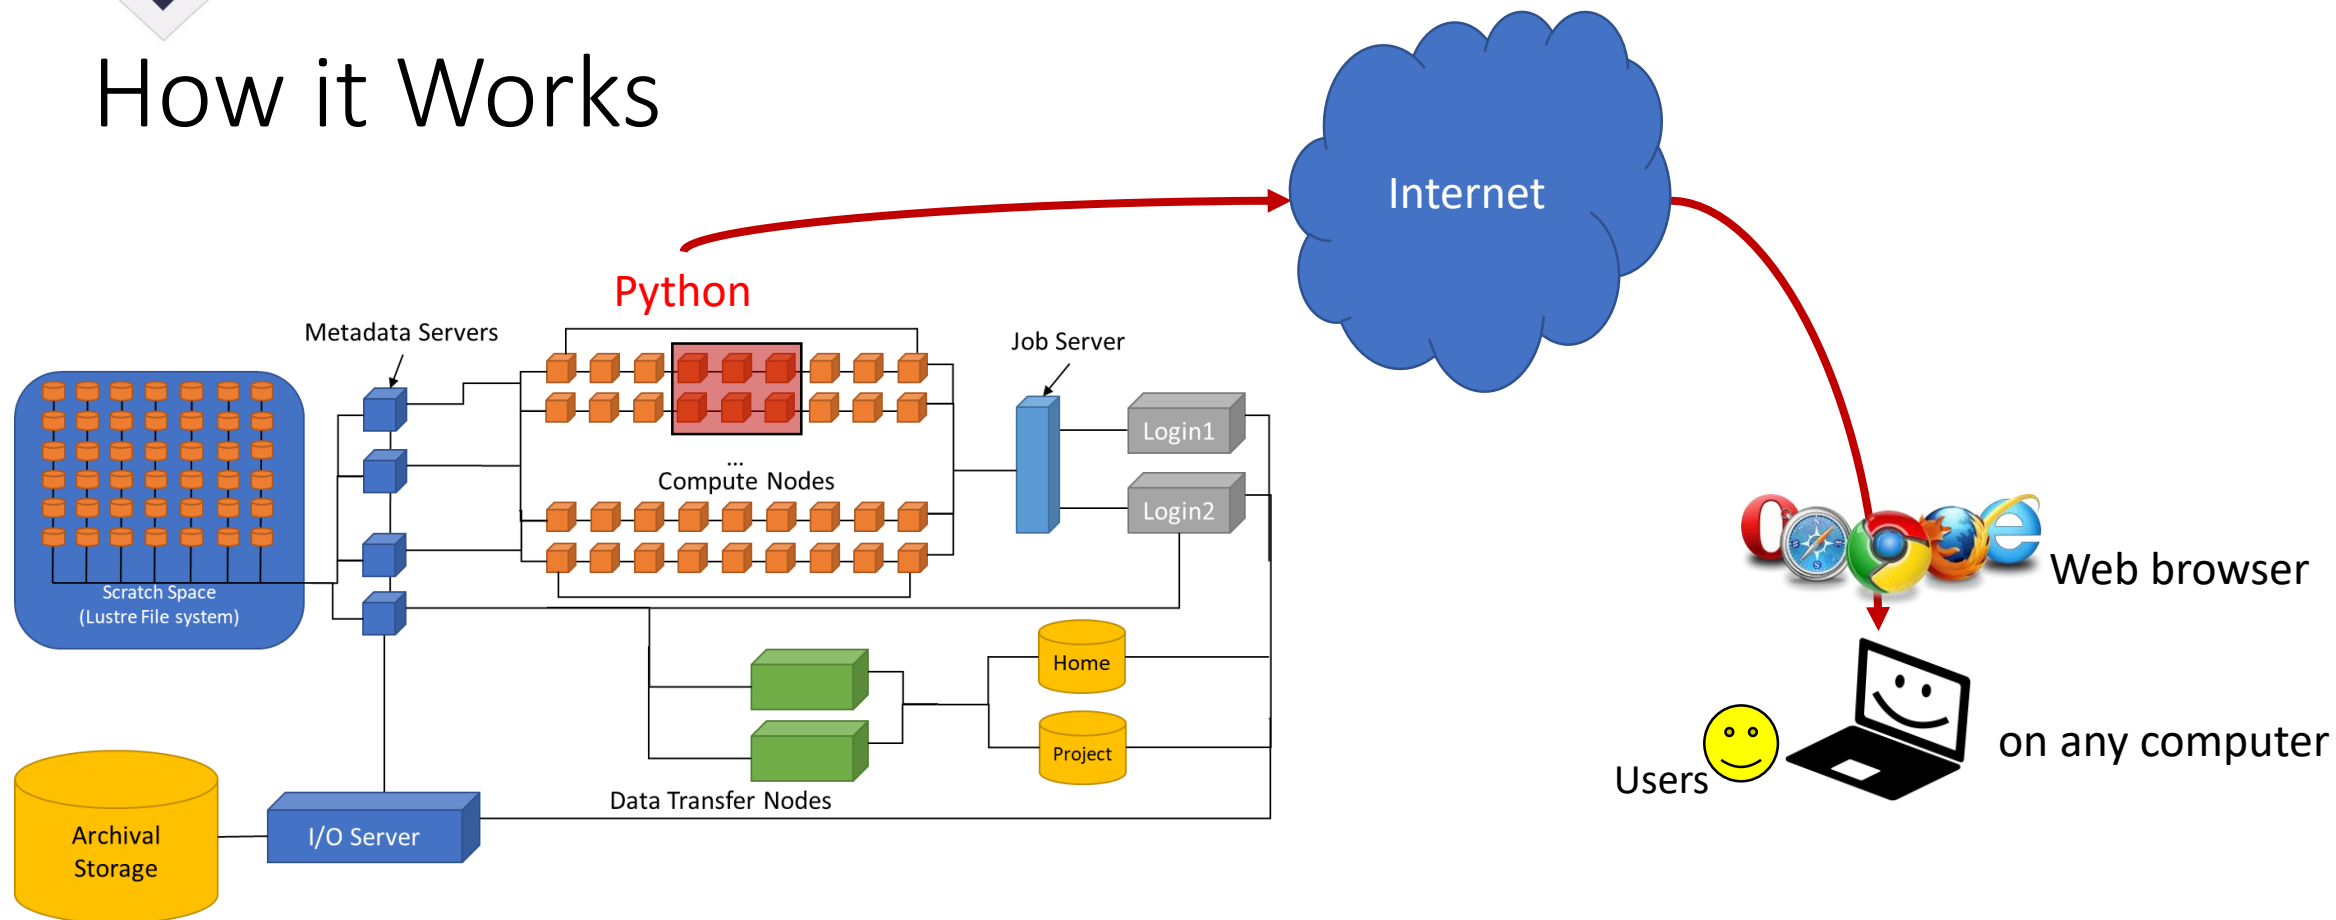

Under the hood

- The IPython Notebook (ipynb) is just a JSON text file
- Suitable for version control with git
- Enhances interoperability with Web applications
 - e.g. Github

```
...
"metadata": {
  "kernel_spec": {
    "display_name": "Python 3",
    "language": "python",
    "name": "python3"
  },
  "language_info": {
    "codemirror_mode": {
      "name": "ipython",
      "version": 3
    },
    "file_extension": ".py",
    "mimetype": "text/x-python",
    "name": "python",
    "nbconvert_exporter": "python",
    "pygments_lexer": "ipython3",
    "version": "3.7.3"
  }
},
"nbformat": 4,
"nbformat_minor": 2
}
```

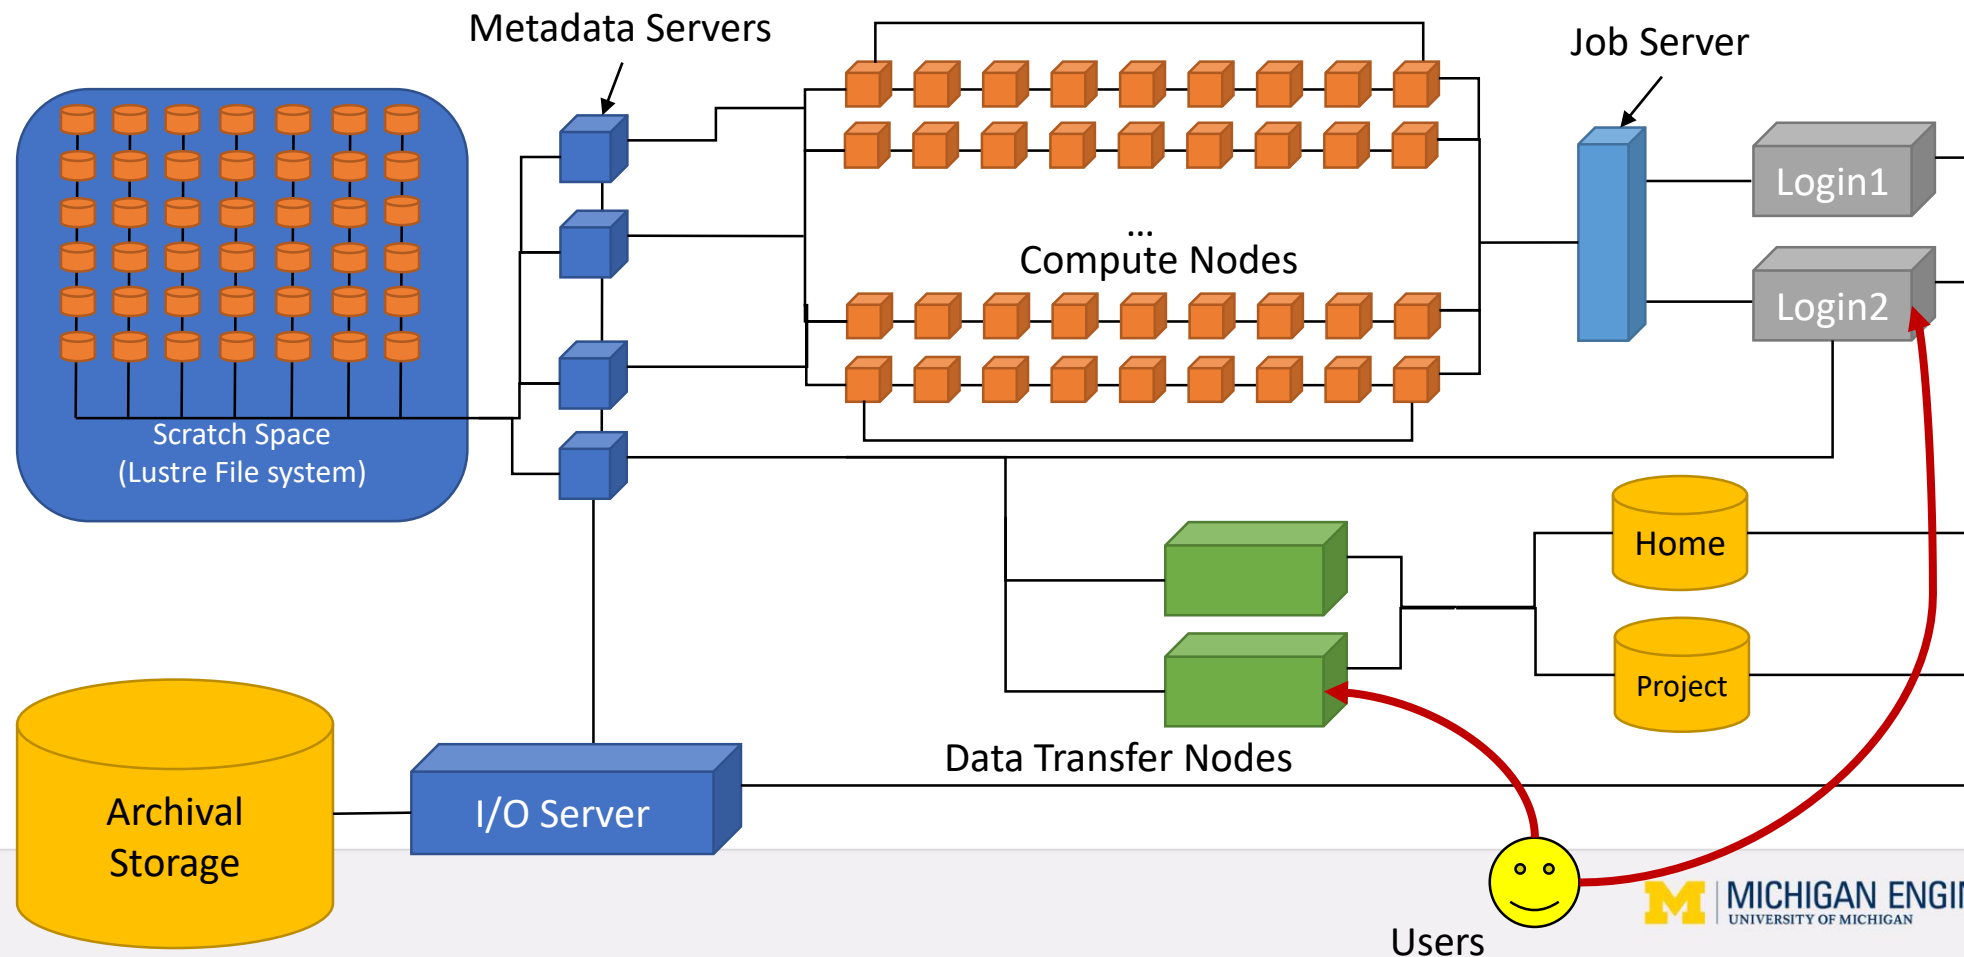

How it Works

Normal HPC Interface

In-line Documentation with Markdown

- Toggle cell type to markdown with `m`
- Toggle cell back to evaluable with `y`
- <https://markdown-it.github.io/>

```
# Title
Some text.
You can write very nicely formatted expositions with markdown.
Text can have inlined source
---
echo "Hello world!"
---
Insert a horizontal line with "==="
===
## Section
Some more Text in _bold_
With an enumerated list
1. First item
2. Second item
3. Third item
### Subsection
and some more text in _italics_
With a list
- First bullet
- Second bullet
- a sub bullet
- Third bullet
#### Subsubsection
Probably a useful [link](https://medium.com/ibm-data-science-experience/markdown-for-jupyter-notebooks-cheatsheet-386c05aeebed)
There are also internal links. Probably should have had the above in [the title section](#Title).
Oh, and you can math  $E = mc^2$ 
```

Title

Some text. You can write very nicely formatted expositions with markdown. Text can have inlined source

echo "Hello world!"

Insert a horizontal line with `===`

Section

Some more Text in **bold** With an enumerated list

1. First item
2. Second item
3. Third item

Subsection

and some more text in *italics* With a list

- First bullet
- Second bullet
 - a sub bullet
- Third bullet

Subsubsection

Probably a useful [link](#) There are also internal links. Probably should have had the above in [the title section](#). Oh, and you can math $E = mc^2$

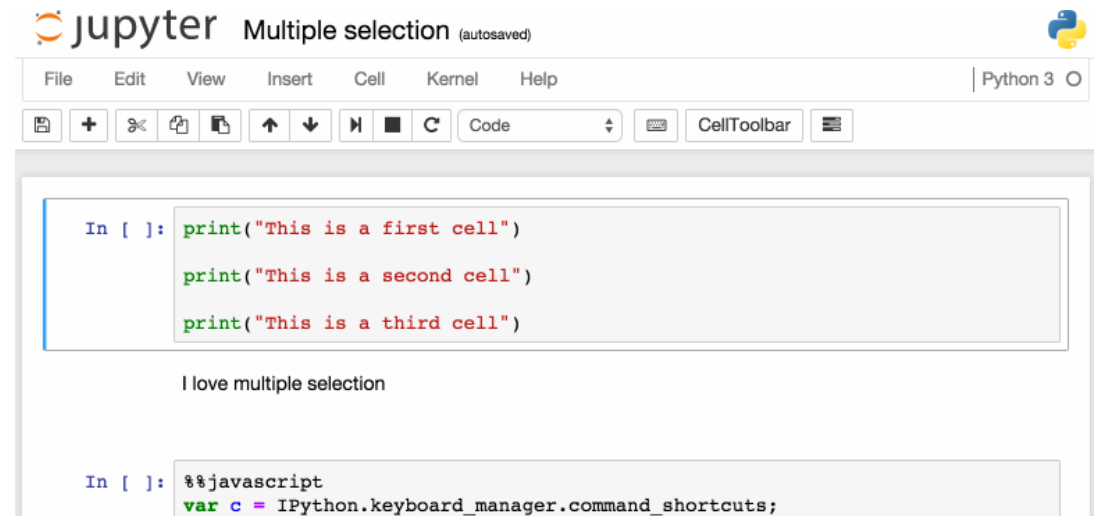

Tips and Tricks

Keyboard Shortcuts

- Command mode and insert mode
 - Just like VIM!
- Adding/removing cells
 - a – insert above
 - b – insert below
 - dd – delete cell (just like VIM!)
- Merging/Splitting Cells
 - Shift + m to merge cells
 - Ctrl + Shift + - to split cell at cursor
- Toggle Output: Esc + o
- Evaluate Current Cell: Ctrl + Enter

Ctrl+Shift+p for Command Prompt

Interacting with the Shell

- Shell commands are simply preceded by a “!”

In [5]: `!ls -l`

In-line Help

- Preced command with a “?”
- Keyboard shortcut for showing doc string of previous word: Shift+Tab

```
In [3]: os.getcwd()  
Out[3]:  
Signature: os.getcwd()  
Docstring: Return a unicode string representing the current working directory.  
In [4]:  
Out[4]:  
Type:      builtin_function_or_method
```

```
In [2]: ?str.replace  
  
Signature: str.replace(self, old, new, count=-1, /)  
Docstring:  
Return a copy with all occurrences of substring old replaced by new.  
  
count  
    Maximum number of occurrences to replace.  
    -1 (the default value) means replace all occurrences.  
  
If the optional argument count is given, only the first count occurrences are  
replaced.  
Type:      method_descriptor
```

Python Magic!

- %load – Load a python file
- %timeit – Time the following command
- %%writefile <filename> – Write cell contents to a file
- %pycat – cat's a file's contents to a popup

Column Selection

- Similar to Sublime Text
- Hold down Alt key and select with mouse

```
In [ ]: x = [  
        'one'  
        'two'  
        'three'  
        'four'  
        'five'  
    ]
```
